The Relationship between Hispanic Immigrants' Occupational Structure and Wages: An Empirical Analysis. This study examines the impact of Hispanic immigration on the U.S. labor market, focusing on the occupational structure and wages of Hispanic workers. It utilizes data from the Current Population Survey to estimate a labor market equilibrium structural model. The results indicate that Hispanic immigration has contributed to the expansion of the labor market and has led to an increase in wages among native-born workers. Additionally, the study finds that Hispanic immigrants are more likely to enter lower-paying jobs, which may explain the observed wage premium for native-born workers. In conclusion, the role of Hispanic immigration in shaping the U.S. labor market is complex, with both positive and negative effects on the economy and society.
